

Polartec® Power Dry®

Smooth, light, flexible polyester fabric, perfect as a first layer of clothing. It is characterized by high breathability, keeps the skin dry, even during strenuous exercise. It has a very delicate finish from the body, which provides all-day comfort. Knit Power Dry provides antibacteriality, dries very quickly.

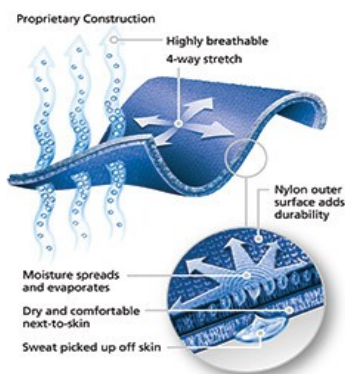

Polartec® Power Dry® materials were created with this in mind, to ensure comfort while maintaining skin moisture away from her. All the types are patented two-component structure that uses two different types of yarns on both sides of the material. This feature creates two different surfaces: the first task is to transport moisture away from the skin to the outside fabric, and the task of the second rapid evaporation of moisture.

How does it work?

Moisture and high humidity on the skin surface cause discomfort. With three mutually complementary mechanisms of Polartec® Power Dry® eliminates moisture on the skin surface:

1. The material breathes well and does not restrict freedom of movement of water vapor.
2. "touch points" on the inner surface of the material absorbs moisture. Sweat is transported from the skin to the outer layer of material which is spread over a larger area and evaporated. Polartec® Power Dry® transports at least 30% more moisture from the skin than one component materials at the same time.
3. When the sweat reaches the outer layer material is spread on the surface many times larger, allowing drying times faster than cotton.

Technical details

- Patented two-component design provides the user comfort, keeping moisture away from the skin
- Excellent breathes providing comfort in all conditions; It does not restrict flow of moisture in vapor form
- Dries quickly
- Soft inner surface provides all-day comfort
- Suitable for washing machines
- Most types of material provides a high sun protection (UPF 15)
